Amendments to the Claims:

This listing of claims will replace all prior versions, and listings of claims in the application:

Listing of Claims:

Claims 1-19 (cancelled)

Claim 20 (currently amended)

~~The integrated circuit of claim 10~~ An

integrated circuit using a memory, said integrated circuit comprising:

an interface circuit configured to control access to said memory, said interface circuit coupled to said memory;

an embedded processor configured to control said integrated circuit, said embedded processor receiving information from said interface circuit; and

an array processor for performing mathematical calculations on data received from said interface circuit and connected to said embedded processor via an internal bus, said array processor comprising:

a plurality of multiplier/accumulator circuits;

a plurality of shared operand circuits coupled to said plurality of multiplier/accumulator circuits for simultaneously providing a shared operand to at least two of said plurality of multiplier/accumulator circuits; and

a shared output and feedback interface coupled to receive outputs from the at least two of the plurality of multiplier/accumulator circuits and to provide them for further processing by the at least two of the multiplier/accumulator circuits.

wherein each of the plurality of shared operand circuits comprise:

a front end unit for determining a fixed point result by performing a fixed point addition or subtraction on a plurality of operands; and

a floating point conversion unit for converting said fixed point result to a first floating point result.

Claims 21 and 22 (cancelled)

PATENT

Claim 23 (currently amended) An integrated circuit comprising:
 a first embedded processor;
 a first array processor coupled to the first embedded processor;
 a first memory interface circuit coupled to the first embedded processor and the first array processor;
 a first communication port coupled to the first embedded processor;
 a second communication port configured to communicate with the first communication port;
 a second embedded processor coupled to the second communication port;
 a second array processor coupled to the second embedded processor; and
 a second memory interface circuit coupled to the second embedded processor and the second array processor,

wherein the first array processor comprises:

a first MAC unit coupled to a first local memory;
 a second MAC unit coupled to a second local memory;
 a third MAC unit coupled to a third local memory;
 a fourth MAC unit coupled to a fourth local memory;
 a shared operand unit coupled to provide a shared operand to the first MAC unit, the second MAC unit, the third MAC unit, and the fourth MAC unit; and
 a shared output and feedback interface coupled to receive a first output from the first MAC unit, and a second output from the second MAC unit, a third output from the third MAC unit, and a fourth output from the fourth MAC unit and further coupled to provide the first output and the second output to the first and second local memories memory, the second output to the second local memory, the third output to the third local memory, and the fourth output to the fourth local memory.

Claim 24 (cancelled)

Claim 25 (currently amended) An integrated circuit comprising:
 a first embedded processor;

Application number 08/993,442

PATENT

an a first array processor coupled to the first embedded processor;
a memory interface circuit coupled to the first embedded processor and the first
array processor;
a first communication port coupled to the first embedded processor and the first
array processor for communicating with a second array processor and a second embedded
processor.

wherein the first array processor comprises:

a first MAC unit coupled to a first local memory;
a second MAC unit coupled to a second local memory;
a shared output and feedback interface coupled to receive a first output
from the first MAC unit and a second output from the second MAC unit and further coupled to
provide the first output and the second output to the first and second local memories; and
a shared operand unit coupled to the first MAC unit and the second MAC
unit, the shared operand unit for simultaneously providing a shared operand to the first MAC unit
and the second MAC unit.

Claim 26 (currently amended) The integrated circuit of claim 25 wherein
the first communication port communicates with a second communication port, the second
communication port coupled to a the second embedded processor.

Claim 27 (currently amended) An integrated circuit comprising:
an interface circuit configured to receive data from an external memory;
an a first embedded processor configured to control the interface circuit;
an a first array processor configured to receive data from the interface and to
perform arithmetic calculations;
a first communication port coupled to the first embedded processor and the first
array processor for communicating with a second array processor and a second embedded
processor.

the array processor comprising:

a first MAC unit configured to receive data from a first local memory;

PATENT

a second MAC unit configured to receive data from a second local memory; and

a first shared output and feedback circuit configured to receive data from the first MAC unit and the second MAC unit, and further configured to provide data to the first local memory and the second local memory.

Claim 28 (previously presented) The integrated circuit of claim 27 wherein the array processor further comprises:

a first shared operand circuit configured to simultaneously provide a shared operand to the first MAC unit and the second MAC unit.

Claim 29 (cancelled)

Claim 30 (currently amended) The integrated circuit of claim 29 28 wherein the array processor further comprises:

a third MAC unit configured to receive data from a third local memory;

a fourth MAC unit configured to receive data from a fourth local memory;

a second shared output and feedback circuit configured to receive data from the third MAC unit and the fourth MAC unit, and further configured to provide data to the first local memory, the second local memory, the third local memory, and the fourth local memory; and

a second shared operand circuit configured to simultaneously provide a shared operand to the third MAC unit and the fourth MAC unit.

Claim 31 (new) A frame rendering integrated circuit comprising:
an interface circuit coupled to an external memory;
an embedded processor coupled to the interface circuit and configured to control the integrated circuit; and

an array processor coupled to the interface circuit, wherein the array processor performs arithmetic calculations;

wherein the array processor comprises:

PATENT

a first multiply/accumulator (MAC) unit coupled to a first local memory,
the first local memory comprising a first plurality of operands;

a second MAC unit coupled to a second local memory, the second local
memory comprising a second plurality of operands;

a third multiply/accumulator (MAC) unit coupled to a third local memory,
the third local memory comprising a third plurality of operands;

a fourth MAC unit coupled to a fourth local memory, the fourth local
memory comprising a fourth plurality of operands; and

a shared operand unit coupled to the first MAC unit, the second MAC
unit, the third MAC unit, and the fourth MAC unit. C

Claim 32. (new) The integrated circuit of claim 31 wherein the array
processor further comprises:

92 /
a shared output and feedback interface coupled to the first MAC unit, the second
MAC unit, the third MAC unit, and the fourth MAC unit, and further coupled to the first local
memory, the second local memory, the third local memory, and the fourth local memory.

Claim 33 (new) The integrated circuit of claim 32 wherein the shared
operand provides a shared operand to the first MAC unit for computing a first result in
association with the first plurality of operands, to the second MAC unit for computing a second
result in association with the second plurality of operands, to the third MAC unit for computing a
third result in association with the third plurality of operands, and to the fourth MAC unit for
computing a fourth result in association with the fourth plurality of operands.

Claim 34 (new) The integrated circuit of claim 33 wherein the first result,
the second result, the third result, and the fourth result are computed independently of each other.

Claim 35 (new) The integrated circuit of claim 34 wherein the shared
output and feedback interface receives the first result from the first MAC unit, the second result
from the second MAC unit, the third result from the third MAC unit, and the fourth result from
